## 豪雨被害: 3万9000人に避難指示・勧告 鹿児島・熊本

活発な梅雨前線の影響で、九州は23日も各地で大雨となり、鹿児島、宮崎両県の間山部では降り始めからの総雨量が1200ミリを超えた。死者数4人、行方不明者数1人は22日から変わっていないが、けが人は鹿児島県と宮崎、熊本の3県でさらに増えて計13人となった。避難指示・勧告は23日午後9時現在、鹿児島、熊本両県で1万6722世帯計3万9245人に出されている。

大雨で冠水した水俣市内＝熊本県水俣市で23日午前8時36分、木葉健二写す

鹿児島県のまとめでは、川内川や米ノ津川(出水市)などの計19カ所で堤防決壊やはんらんが起き、さつま町や大口市など6市町の1905棟が床上・床下浸水。川内川周辺では集落の周囲が完全に水没し、孤立状態になった所もあった。

Human behavior under inundation

Limit of actions based on structure construction

+

Non-construction approach to mitigate flood damage

Rescue activity from residents' community

# Causes of human damage under flood disaster

Prof. Ushiyama have classified them to 5 categories as follows;

- **Land slide** Including avalanche of rocks and earth
  - **Tidal waves**
  - **Strong wind**
- Typhoon & Heavy rain
- Early warning is effective.

- **Inundation** Drowning in their house, on the way to evacuate  
Accident of their passive behavior  
(fall down to sewage...)
- **Accident** Drowning :results of their active behavior  
(checking their crops, conditions of irrigation canal...)

These damages depend on individual human behavior based on their will.

It is necessary for human damage mitigation to approach to individual human behavior.

# Human Behavior under Flood: Current Status

- Low ratio of evacuation
- Failure to evacuation

On Tokai heavy rain (2000) , in Nishi-biwajima area  
8.6% people wanted to but could not evacuate,  
10.6% people could not evacuate and was rescued.

Some people ignore it, because they think they are safe. (Low Awareness)

Evacuation Order from Local Government

Some people cannot evacuate without it.

Some local government cannot issue,  
because they don't have draft guidelines  
and be afraid of mistake of judgment.

Safe autonomous evacuation based on the judgment  
by residents is needed

# Research Purpose

Human damage mitigation based on non-construction approach.

Risk communication is one of the most powerful tool for non-construction approach.

Development of flood risk communication support information system

## In this presentation

Modeling of human evacuation behavior as a mental model

Development of GIS based support information system  
for construction and reconstruction of users' mental model

Flood risk communication using developed support system  
in Kiyosu City, Aichi Pref., Japan

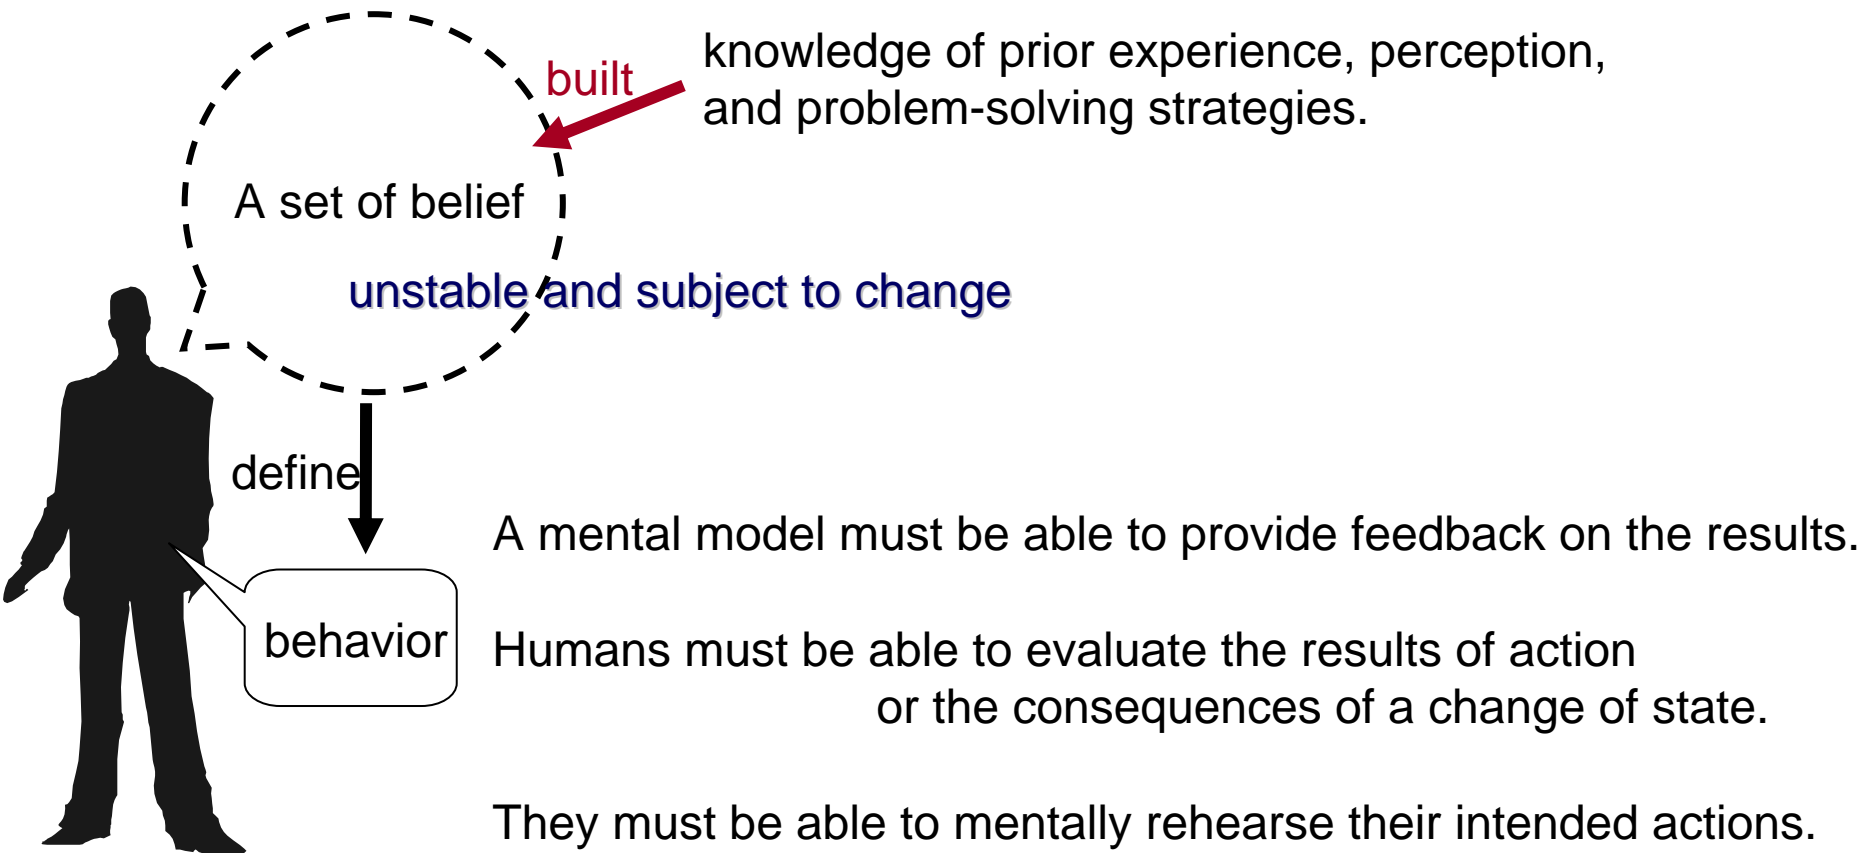

# Mental model approach

To built a concept for system

Personal decision making is based on their internal “mental model.”

For purposes of the discussion we consider the following descriptions of mental models.

A mental model is a set of belief and an internal scale-model representation of an external reality.

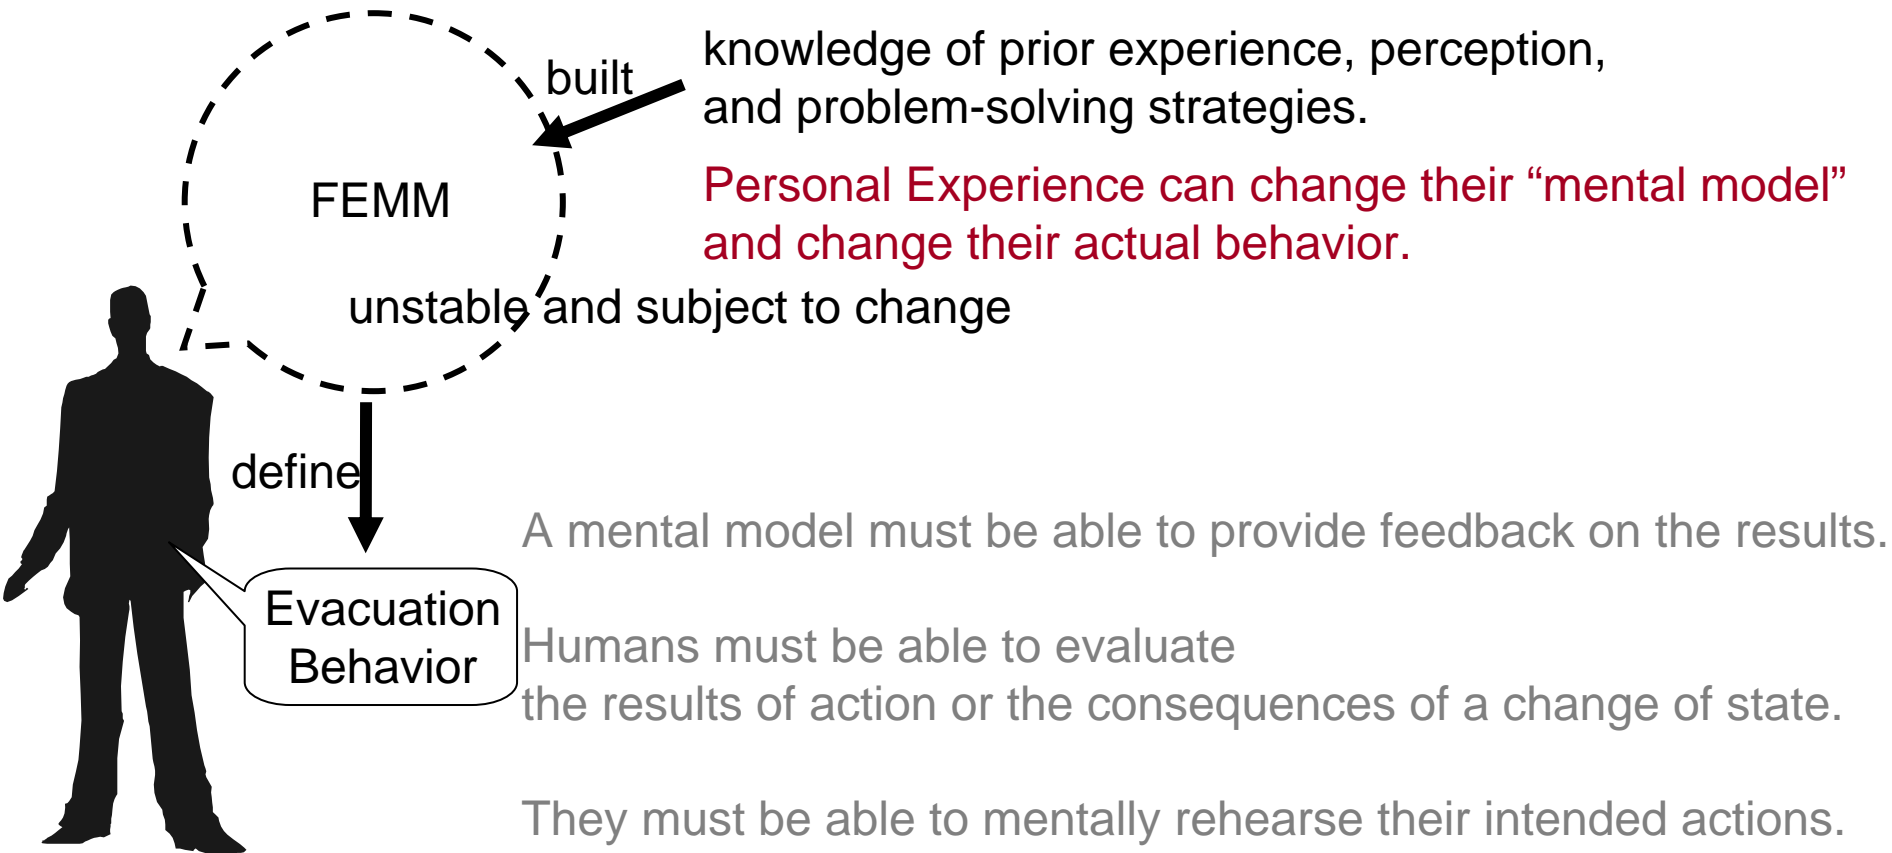

# Flood Evacuation Mental Model (FEMM)

defined as a mental model in terms of flood evacuation

Evacuation decisions based on the personal FEMM which is a set of belief on the possible evacuation plans, includes

- “message” to know what is the current situation,
- “knowledge” to categorize the situation,
- “alternatives set” for evacuation plans.

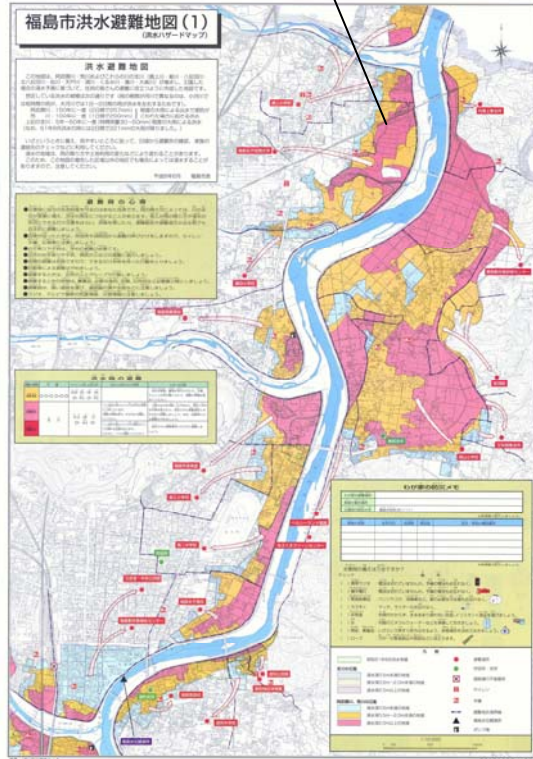

# Flood Hazard Map

To realize a paradigm shift

made and provided by local government is one of the most powerful tool.

Purpose: to lead to residents' effective (fast and smooth) evacuation under flood to increase residents' awareness of flood risk

Overlay the values of max depth based on the result of simulation

Example of Hazard Map

However, according to fact-finding inquiry

It is pointed out that flood hazard maps often leads citizens to fixed and inflexible belief about flood risk. Despite the governments' effort, many households lost the maps and some of them don't recognize the existence of the maps.

## What is a Lack of Hazard Map?

It is hard for residents to change their FEMM from macro information. They need follow up communication to change information for from area to individual.

# Flood Risk Communication Support System

The system will help citizens making their own evacuation plans by providing evaluation of their self-developed plans across different flood scenarios.

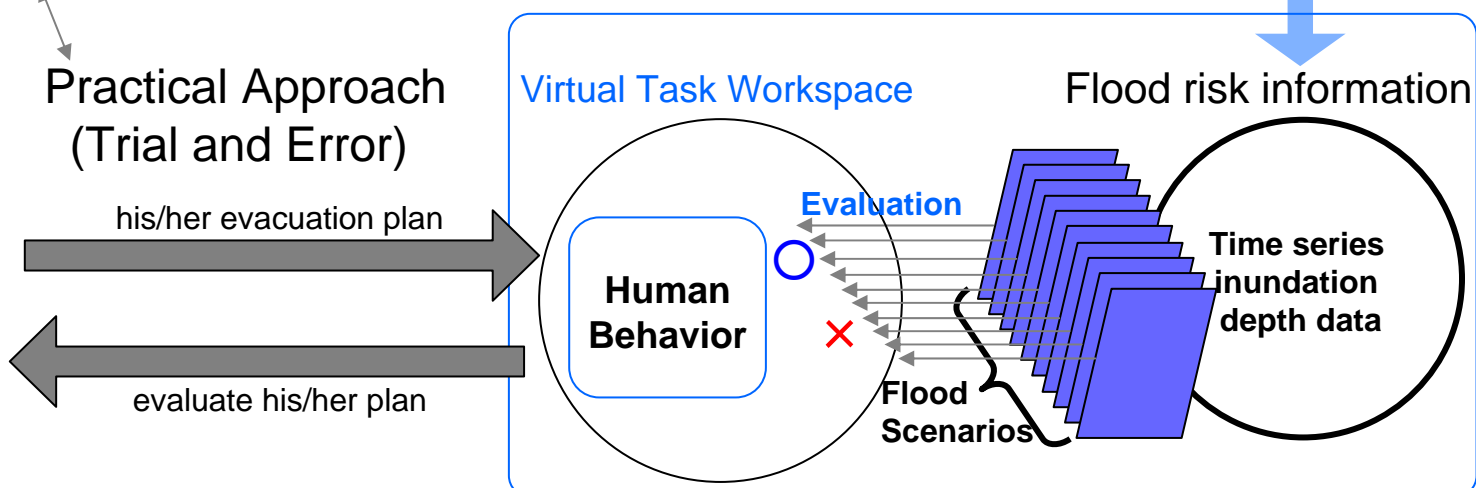

Theoretical Approach (Education...)

Practical Approach  
(Trial and Error)

Flood analysis for several scenarios

Customer

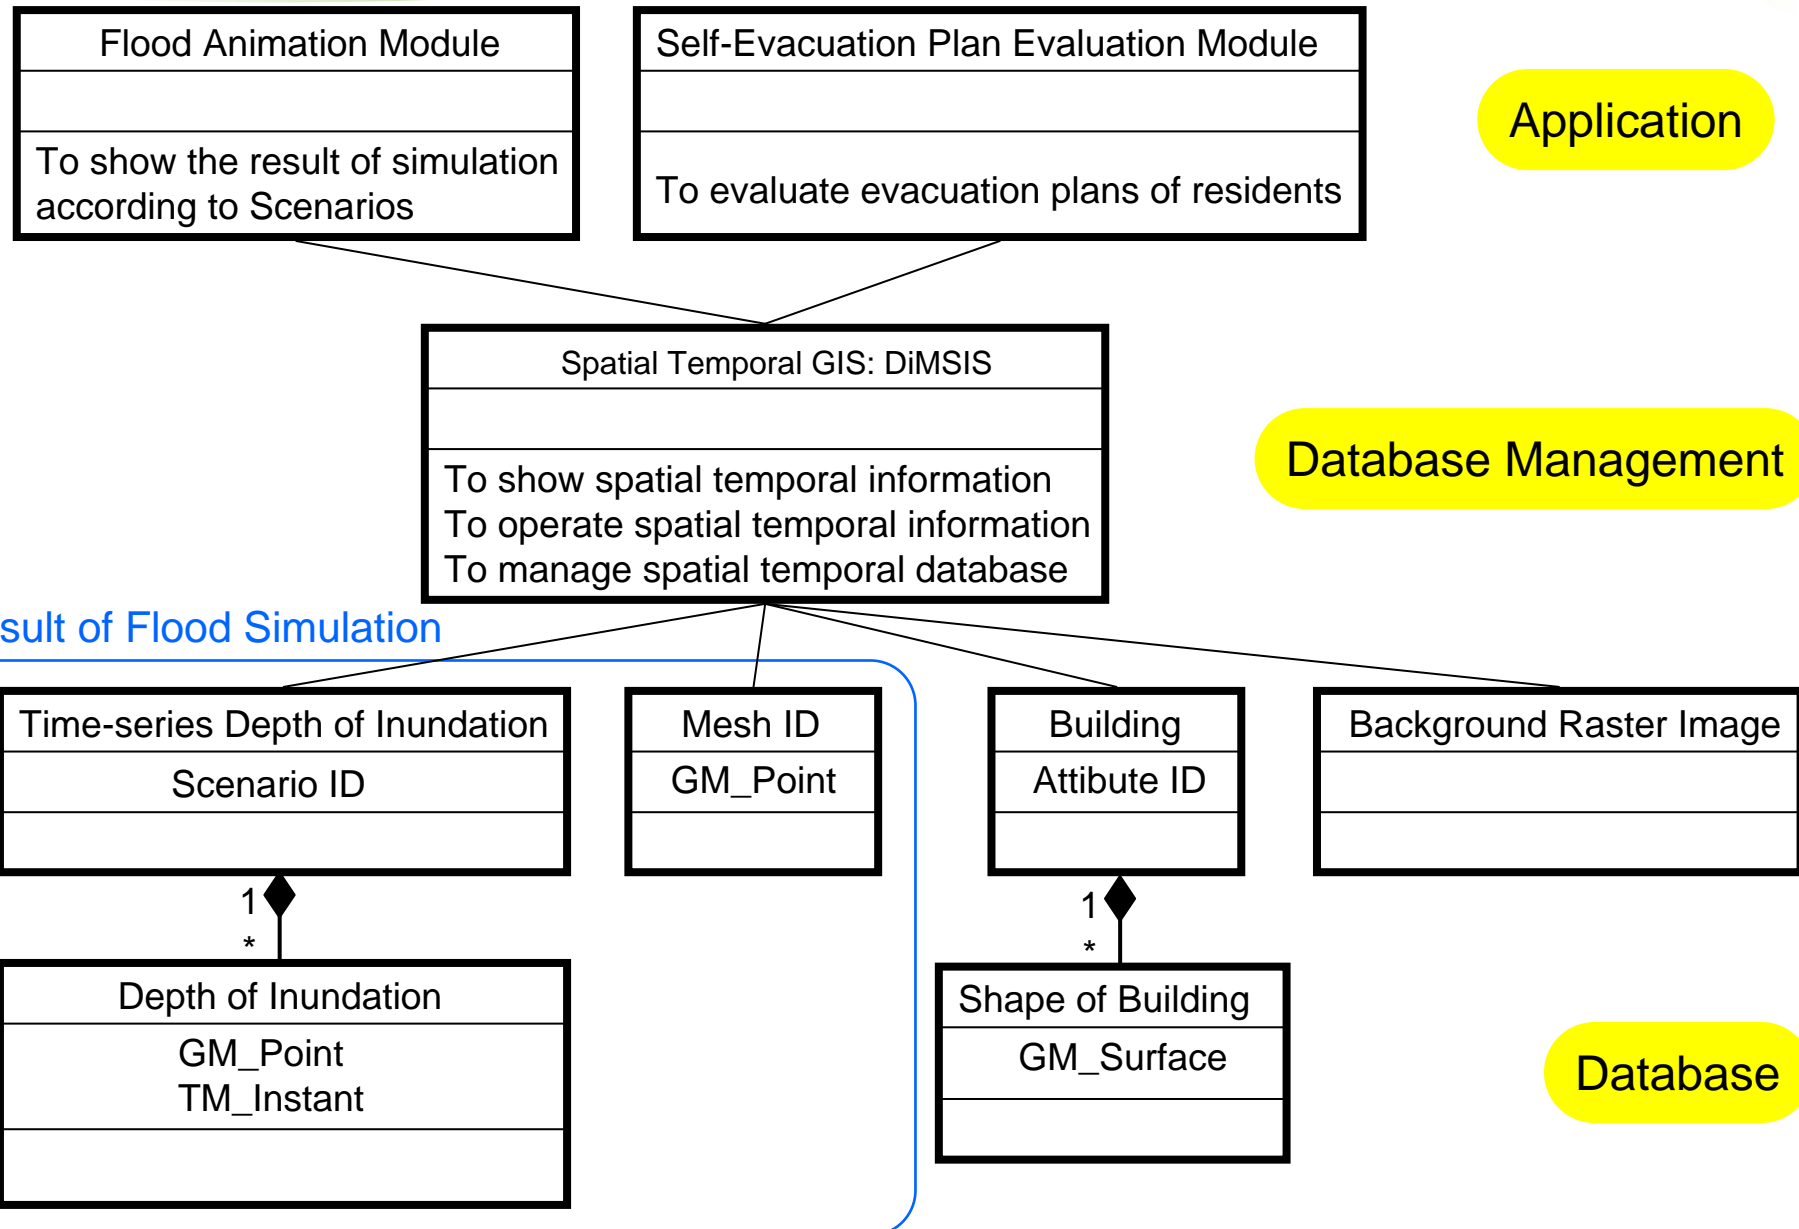

Flood Risk Communication Support System

Customer tests their plan to several scenarios by trial and error to check and reconstruct, if need, their FEMM.

**From Hazard Map to Risk Imasimulator  
(Imasimulator = Image + Simulation)**

# UML Diagram of developed information system

# Risk Communication Case Study

Date: 2nd, 3rd Feb. 2006

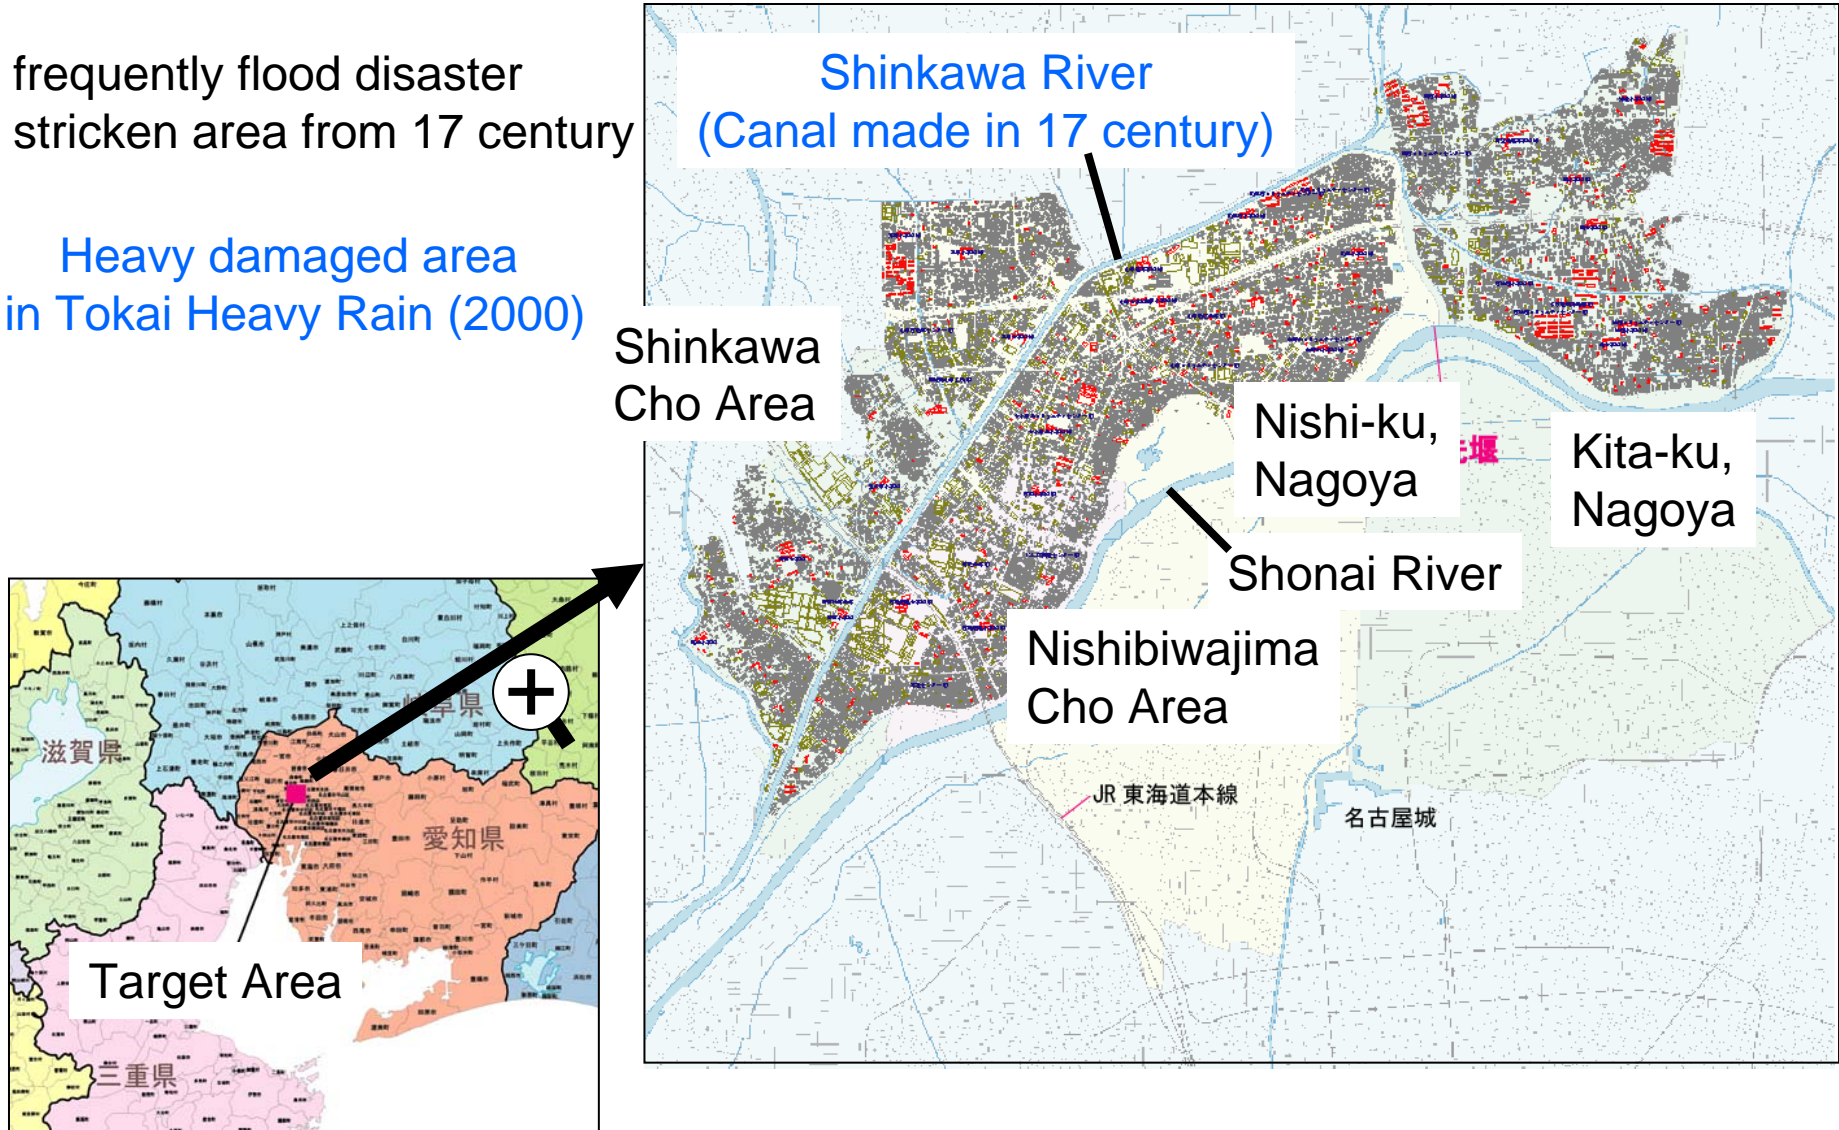

Target Area: Kiyosu City, Aichi Pref.

# Target Area: Shinkawa River Basin in Kiyosu City

Nishibiwajima cho area (Population: 19,000, Area: 4.70km<sup>2</sup>)  
Shinkawa cho area (Population: 8000, Area: 3.36km<sup>2</sup>) 2005

frequently flood disaster  
stricken area from 17 century

Heavy damaged area  
in Tokai Heavy Rain (2000)

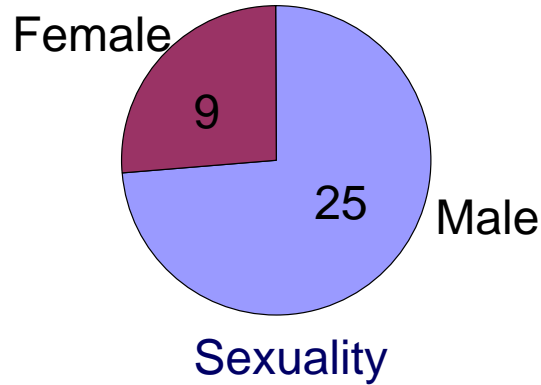

# Risk Communication Case Study

Date: 2nd, 3rd Feb. 2006

Target Area: Kiyosu City, Aichi Pref.

Participants: 34 person (Shinkawa area(17), Nishi-ku(3), Nishibiwajima(14))

## Experience of Tokai Heavy Rain(2000)

# Flood Disaster Simulation Data

Made by River Division of Aichi Pref.

- 50m Mesh Data
- Integrated 68 scenarios
  - 5 scale of rainfall (including Tokai Heavy Rain )
  - Break in dykes of Sinkawa River (Break point 1km pitch)
  - Inner water (Sewage:  $w \geq 1\text{m}$ , Waterway:  $w \geq 3\text{m}$ )

## Evacuation Trigger

From this data and standard guideline of evacuation order of local government, we set following timing as “evacuation trigger”

- Evacuation Order
- Flood Prediction
- River Water Levels
- Rainfalls

## Human Evacuation Behavior

We assume that HEB is regulated by the **place (from, to)**, **route**, and **trigger** to evacuate

# Self-Evacuation Plan Evaluation Module

## Evacuation Shelter

Official Shelter  
Alternative Shelter  
(Buildings more Than 5m high)  
Other Places

## Route

can be chosen arbitrary.

## Trigger information

Evacuation Order  
Flood Prediction  
River Water Levels  
Rainfalls

避難条件の設定

ご自身の身長を設定してください。

|       |      |
|-------|------|
| 140cm | 設定完了 |
| 145cm |      |
| 150cm |      |
| 155cm |      |
| 160cm |      |
| 165cm |      |
| 170cm |      |
| 175cm |      |
| 180cm |      |
| 185cm |      |
| 190cm |      |

設定し直し

避難するときの速さを設定してください。

時速 **2.016** km

防災計画の避難速度

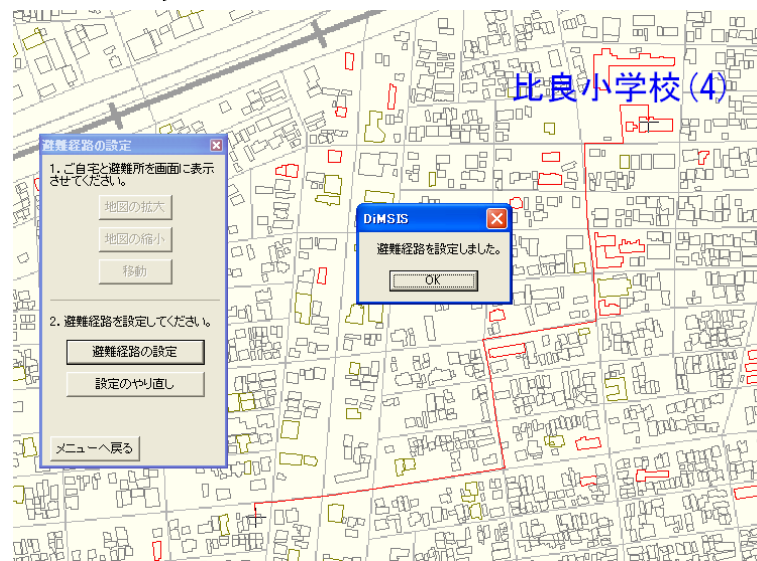

|        |         |
|--------|---------|
| 地震防災計画 | 1.0km/時 |
|        | 1.5km/時 |
|        | 2.0km/時 |
|        | 2.5km/時 |
|        | 3.0km/時 |
|        | 3.5km/時 |
|        | 4.0km/時 |

通勤時平均歩行速度

避難のタイミング設定

避難を開始するきっかけを選んでください。

避難勧告準備情報

避難勧告  
洪水警報  
大雨警報  
新川の水位  
流域の雨量

清須市によって、洪水や浸水の恐れにより、避難が勧められる場合に発表されます。

サイレンが鳴り、防災スピーカー(防災無線)、自主防災会、広報車、消防車を通じて伝えられます。

設定し直し 次へ

避難開始までの時間を選んでください。

普段から持ち出し品を準備しておき、すぐに避難を開始する。

10分後

準備、印紙、アルミ缶等、最低限のものをまとめてから持って逃げる。

30分後

持ち出し荷物をまとめ、さらに1階の家具を2階に上げる。

1時間後

-10 きっかけから 30 分後 +10

参考:  
2000年東海豪雨災害時の西枇杷島町における避難開始のピークは、避難勧告発表の1時間後でした。

# Flood Animation Module

The screenshot displays the '災害リスク表示システム (京都大学防災研究所)' (Disaster Risk Display System) interface. The main window shows a map of a flooded area with a color-coded legend for water depth. The legend, titled '凡例 浸水深', includes the following categories:

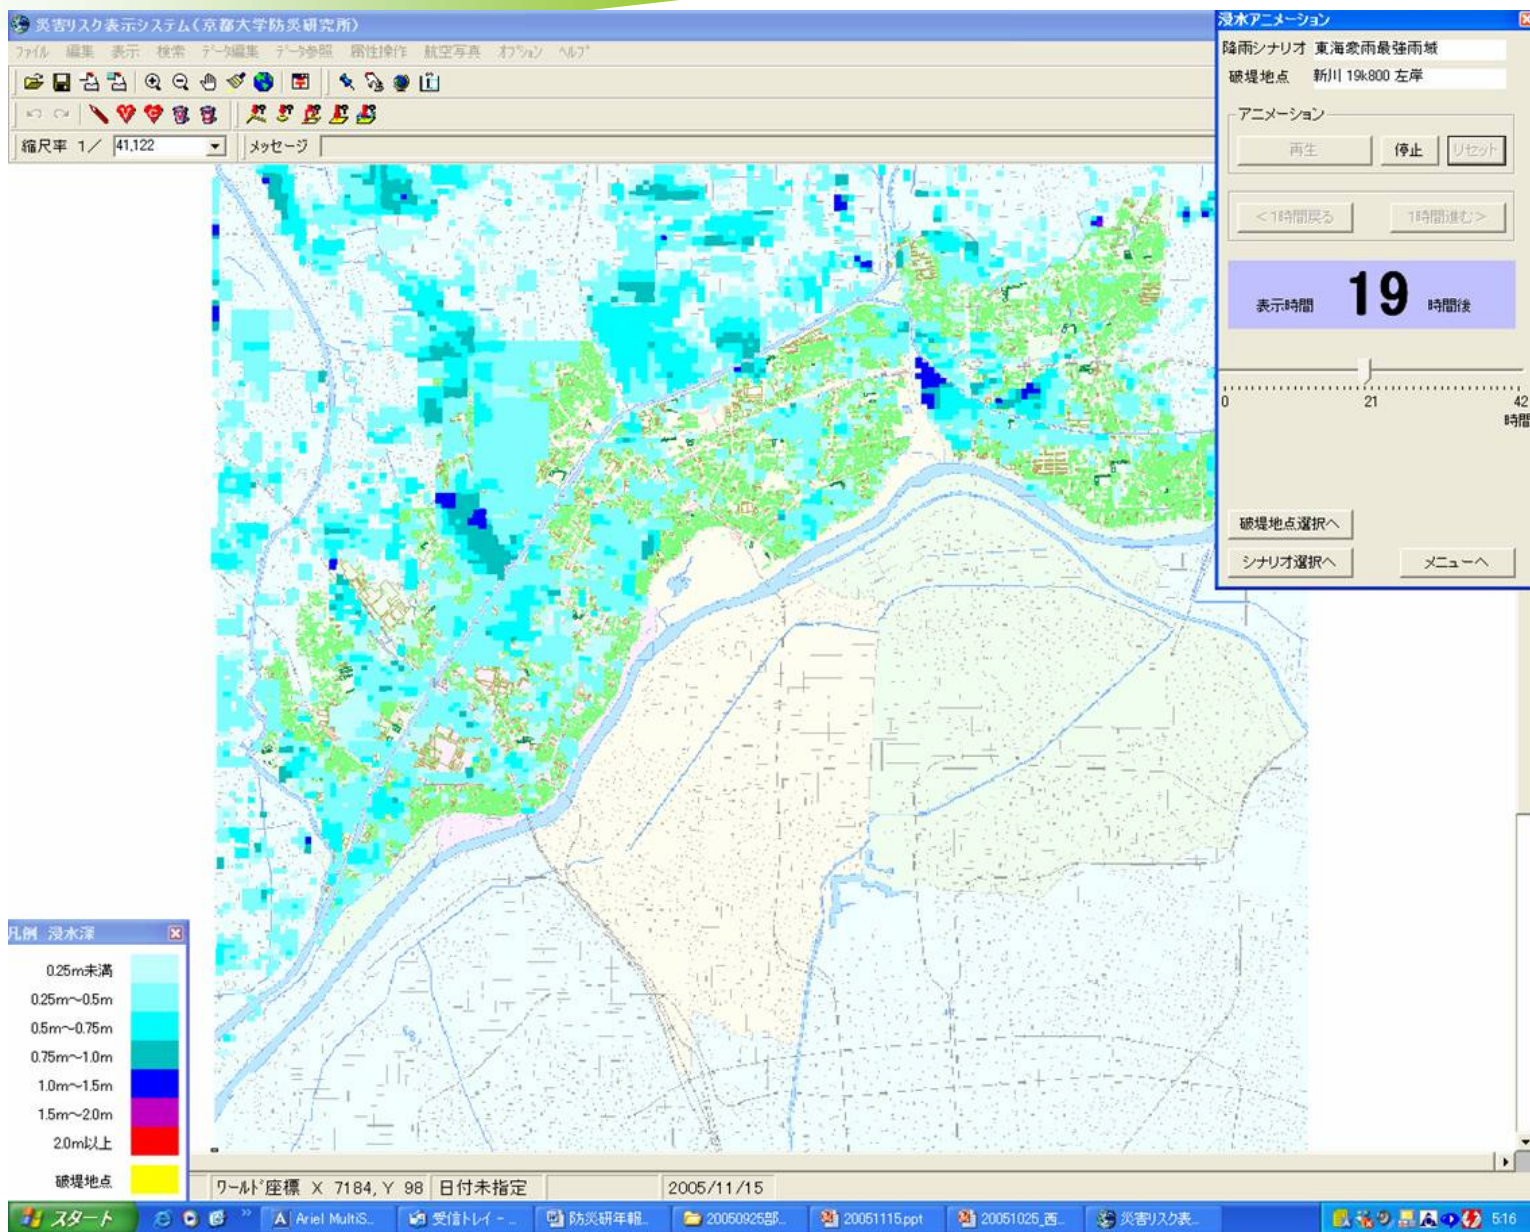

- 0.25m未満 (Lightest blue)
- 0.25m~0.5m (Light blue)
- 0.5m~0.75m (Medium blue)
- 0.75m~1.0m (Dark blue)
- 1.0m~1.5m (Blue)
- 1.5m~2.0m (Purple)
- 2.0m以上 (Red)
- 破堤地点 (Yellow)

The right-hand control panel, titled '浸水アニメーション', contains the following elements:

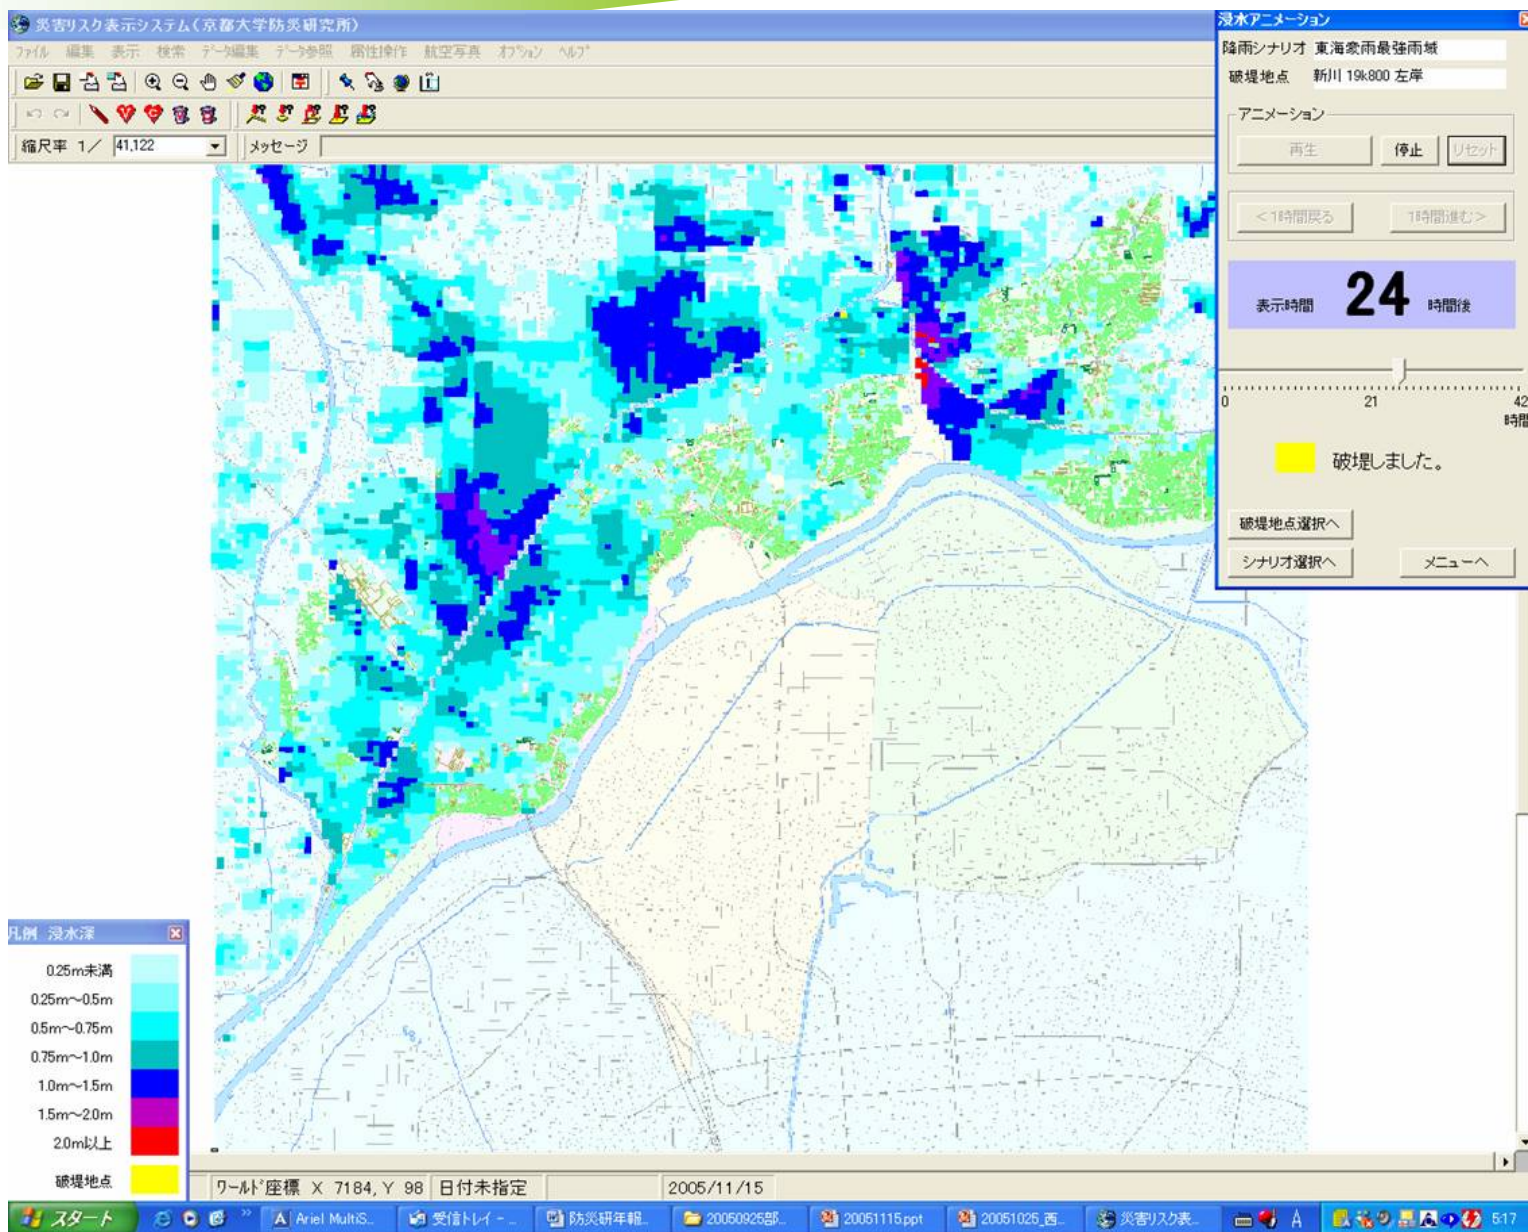

- Scenario: 降雨シナリオ 東海豪雨最強雨域 (Rainfall Scenario: Tokai Heavy Rain Strongest Rain Area)
- Breakage Point: 破堤地点 新川 19k-800 左岸 (Breakage Point: Shinokawa 19k-800 Left Bank)
- Animation controls: 再生 (Play), 停止 (Stop), リセット (Reset)
- Navigation: <1時間戻る (Previous 1 hour), 1時間進む> (Next 1 hour)
- Display Time: 表示時間 13 時間後 (Display Time: 13 hours after)
- Timeline: A slider from 0 to 42 hours.
- Buttons: 破堤地点選択へ (Select Breakage Point), シナリオ選択へ (Select Scenario), メニューへ (Menu)

The bottom status bar shows the current location as 'ワールト' (Ward) with coordinates X 10701, Y 3691, and the date '2005/11/15'. The Windows taskbar at the bottom indicates the system time is 5:15.

Questionnaire (check their status before experiment)

Make small group

Trial of developed system one by one  
(The other people in same group watch his/her trial)

Group communication

Questionnaire (check their status after experiment)

# Evaluation from Questionnaires

## Did they increase their awareness?

Question on probability of inundation (under/above floor) of their houses in 7 stages evaluation

|                            | before           | after  |                |
|----------------------------|------------------|--------|----------------|
| We can find the increasing | Under floor 5.46 | → 6.21 | on the average |
|                            | Above floor 5.21 | → 6.00 |                |

## Did they increase their preparedness?

Question on preparedness of emergency baggage in their houses

20/34 people had never prepare before.

After experiment 11/20 people changed their mind and decided to prepare it.

Next I show the explicit knowledge from group communication..

# Communication result 1

In this case, before warning information for evacuate is provided, their route to reach the official shelter is not available for the most of scenario.

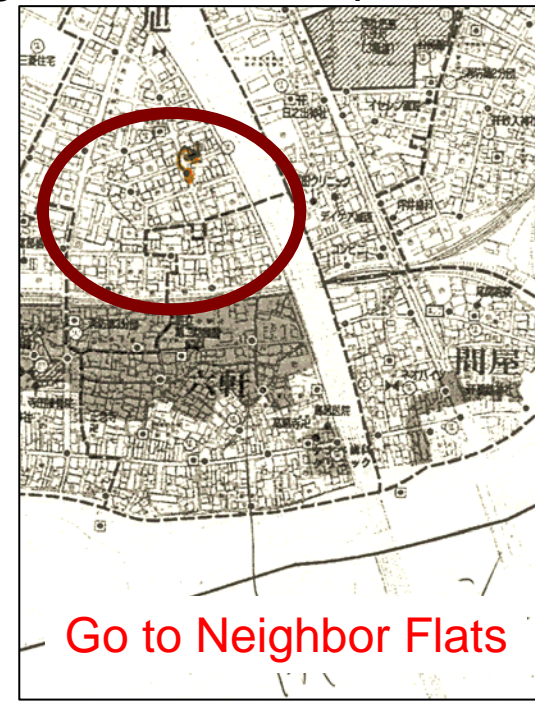

Half of Participants of this group changes the shelter location and new self evacuation plans after using the system

An example of change of evacuation plan

Before

After

The workshop which using the FRC support system helps citizens to obtain more appropriate self-evacuation plan.

# Communication result 2

Official Shelter  
Toei Elementary  
School

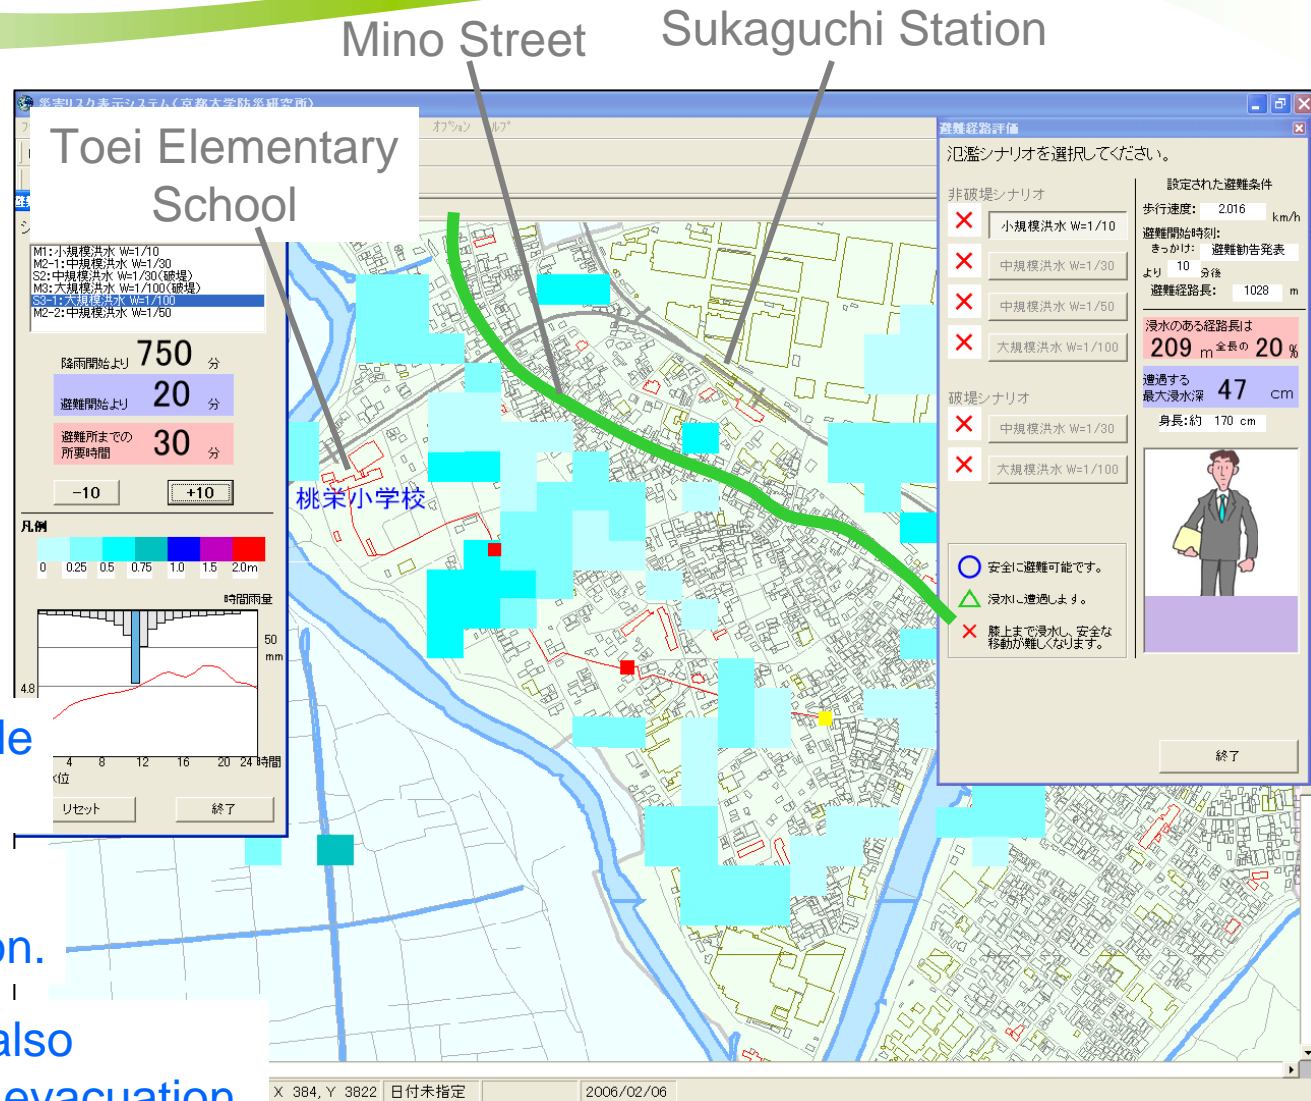

Isolated area  
when LG issues  
an evacuation order.

Remark of participant

- “Mino Street” is available to reach official shelter.
- It is also available for temporary evacuation.
- “Sukaguchi Station” is also available for temporary evacuation.

Through group discussion, participants shared some evacuation plans

# To improve system

I can show the possibility to reconstruct individual FEMM by our developed system. Our group have a plan to continue risk communication in this area. Through this case study, I get some idea to improve our support system as follows;

It is important to input the explicit knowledge from participant. It is also important to input the historical incidents such as Tokai Heavy Rain. We have to relay the knowledge to the other person or next generation through the system.

We have to collaborate theoretical approach system, because correct understanding is also important for risk communication. In the first step, it is desired to be able to select theoretical or practical approach

From individual evacuation to community evacuation, We try to extend communication topics to help the disaster weak people. (Most of drowning people in their house are aged and disable.)

# Conclusion

Modeling of human evacuation behavior as a mental model

Development of GIS based support information system  
for construction and reconstruction of users' mental model

Flood risk communication using developed support system  
in Kiyosu City, Aichi Pref., Japan
