‘Invisible structure’ (infrastructure) comprises the material and organisational components of an organisational-technical system in which the management system has disappeared (and so is invisible). There are users and for them the infrastructure appears as a network to which they can be connected. There are different types of infrastructures – material, normative, virtual, and others. The infrastructural form of organisation serves the public interest (and hence is maintained by the state or public organisations) unlike other organisational forms promoting private (local) interests.
