### The Dynamics of Educational Attainment by Age and Sex

Educational attainment changes the population by age and sex. This is important because fertility, migration, and economic growth are affected by the age and sex structure of the population. This data sheet contains the most recent and comprehensive data on the educational attainment of men and women in various Asian countries, including the following key indicators:

- Proportion of women aged 20-29 with at least primary education
- Proportion of women aged 25-29 with at least secondary education
- Proportion of women aged 45-49 with at least tertiary education
- Proportion of men aged 20-29 with at least primary education
- Proportion of men aged 25-29 with at least secondary education
- Proportion of men aged 45-49 with at least tertiary education

The data sheet also presents the educational attainment levels by age group for both men and women across different countries in Asia. This information is crucial for understanding the impact of educational attainment on fertility, migration, and economic growth. The data is sourced from a variety of reputable organizations and is presented in a table format for easy analysis. The data highlights the importance of education in shaping the future of Asian countries.
